

Zones

A zone is a fragment in the HTML source which can be updated independently from other parts. It is identified with the `nd-zone` attribute.

Basic setup

Zones may me set up like this this (case I) :

```
<div nd-zone="my_zone">
  <p nd-zone-item="first-paragraph">
    <!-- first paragraph from sse -->
  </p>
  <h2 d-zone-item="subtitle"><!-- Subtitle from sse --></h2>
  <p nd-zone-item="second-paragraph">
    <!-- second paragraph from sse -->
  </p>
</div>
```

, or like this (case II) :

```
<div nd-zone="forms">
  <!-- Forms zone -->
</div>
```

In case I , the server my send update events with specific data for specific . Only the elements bearing the `nd-zone-item` attribute specified in the server response will be updated.

In case II, the whole zone will be updated with the server response since no elements bearing an `nd-zone-item` attribute are specified.

Actions

Following actions max be performed on a zone :

Action	Effect	Behind the scene	Applies to
hide	Hides the zone	The display style is set to <code>display: none</code>	Zone
show	Shows the zone	The display style is set to <code>display: inline</code>	Zone
clear	Clear all fields bearing a <code>name</code> attribute, except <code>csrf</code> token fields	Removes focus of the <code>document.activeElement</code> and set it to the first element in the zone bearing an <code>autofocus</code> attribute	Zone containing forms

Action	Effect	Behind the scene	Applies to
update	The zone is updated	If elements bearing a <code>nd-zone-item</code> attribute exist, they are updated with specific content. If not, the zone content is replaced. The container fragment is reprocessed.	Zone
remove	Remove a zone from the DOM	The content of a zone is deleted. The container fragment is reprocessed.	Zone
